

Report of Work Done by the Carnegie Museum

at the Dinosaur National Monument in Uinta County, Utah,

under the Supervision of Earl Douglass, in the Year 1922.

For Rec. of *Publication*

n During the year 1922, the work in the Dinosaur Quarry was confined to the eastern part--east of the "Old Quarry"--in what has been called the East Extension.

The maximum length of the quarry-workings, measured along the bottoms of the cuts in the East Extension and the West Extension, is about 400 feet. The sandstone ledge which contains the bones and skeletons of the Dinosaurs is tilted to an angle of 60 degrees, and therefore lacks only 30 degrees of being perpendicular. The sandstone is a river deposit, and, being harder than the overlying and underlying clays, weathers into a prominent ledge. The quarry is in the highest portion of the ledge in "Dinosaur Peak". On the east and west sides are deep gulches which flow southward to Green River which is about a half mile distant. As the ledge extends east and west these gulches cut it at right angles. The line of the upper part of the quarry nearly coincides with the top of the eroded ledge, and the bottom line is in line with the bottoms of the cuts in the East and West extensions, therefore it is in approximately the form of a crescent or the segment of a circle. The excavating during 1922 was in the eastern horn of this crescent or segment. The map which accompanies this shows the location and areal extent of this excavation and the skeletons which were uncovered and removed.

Report of Quarry 1922--2.

About 700 square feet of the ~~same~~ ~~bone~~ bone layer was stripped and all but two skeletons--those of Diplodocus--were removed. As near as can be measured, rock to the extent of approximately 20,000 cubic feet was removed during the year.

A drag trail had been previously made up to the workings at the east end of the quarry. This went back of the hill and took the place of the old steep trail up the west side of the peak. As the grade was comparatively easy this, in 1922 was widened into a road and for the first time wagons went up to the quarry--in fact a car made the trip two or three times. It was necessary to do considerable work on the road from the quarry, for a distance of three miles or over, toward the Victory Highway which is about seven miles distant.

The following are the skeletons which were taken out or partly taken out during the year.

No. ⁶⁰39--Stegosaurus. Three large blocks.

No. 301--Complete skeleton of new, undetermined Dinosaur. Four blocks.

No. 333--Small undetermined Sauropod Dinosaur, probably undescribed. Complete skeleton. All taken down in 1922.

No. 345--Undetermined Dinosaur. Large part of skeleton.

No. 340--Diplodocus. Apparently nearly complete skeleton but only neck taken out. The remainder still in the ledge.

No. 350--Stegosaurus. Nearly complete skeleton. Removed in 1922.

No. 360--Minute Dinosaur. Perhaps a "Baby Dinosaur".

No. 365--Skull of Dinosaur. Undetermined.

No. 366--Parts of Skull and Skeleton of small undetermined Dinosaur.

No. 370--Camptosaurus? Nearly complete skeleton.
